SUMMARY

Full Stack Engineer who specializes in Java and Spring Boot on the back-end for business logic and validation with React on the front-end to display findings in a customer first approach. Working with cross functional teams to bridge the gap between data insights and technical execution. Drove a 25% increase in user engagement tracking by developing a scalable, real-time platform that replaced a legacy BI reporting system.

EXPERIENCE

Southern Glazer's Wine & Spirits, Farmers Branch, TX — *Business Intelligence Manager*

June 2023 – July 2025

- Collected raw data via Business Objects and transformed it into data visualization dashboards for stakeholders and suppliers to make sound business decisions based on sales metrics of the products in demographic areas of Texas, which helped increase sales for certain products by 10%.
- Became the subject matter expert of a budget tracking system that allowed stakeholders to view and manage their spending of advertisement, point of sales, and marketing projects through 3rd party vendors.
- Created custom dashboard templates for stakeholders to track their volume goals for each quarter, with historical data to compare their growths and/or losses throughout the year.

Southern Glazer's Wine & Spirits, Farmers Branch, TX — *Business Intelligence Analyst*

Jan 2022 – May 2023

- Reduced project delivery times by 30% by identifying and resolving bottlenecks in the data reporting pipeline and automating live data updates daily.
- Collaborated with cross functional teams to define project requirements and delivered tailored, data-driven software solutions.
- Assisted the Finance team with finding marginal drains within the stakeholders portfolio and communicated suggested actions that could be implemented to increase margins by 2%.

Southern Glazer's Wine & Spirits, Farmers Branch, TX — *Night Warehouse Supervisor*

Mar 2020 – Dec 2021

- Led a team of 25 employees, coordinating operations to meet strict performance deadlines and improve on time delivery by 5%.
- Optimized logistical workflows and practices which resulted in a 30% reduction in missing products from deliveries.
- Conducted safety checks of equipment and PPE before every shift which reduced on the job accidents by 5%.

PROJECTS

Dallas Learning Center (Full Stack)

Tech Stacks: Java Spring Boot, React, Typescript, PostgreSQL, Hibernate

Feb 2026 – March 2026

- Architected and developed a full-stack application enabling parents and students to track academic progress and session history in real time.
- Built in a React + Typescript front-end with reusable components and structured state management to ensure scalability and maintainability.
- Designed relational database schemas in PostgreSQL to support session tracking, user roles, and financial transactions.
- Engineered back-end services using Spring Boot and Hibernate to support complex credit-based booking logic, ensuring transactional integrity (ACID compliance).
- Standardized the CI/CD pipeline by integrating version-controlled seed data, ensuring the application remains robust and production-ready across different environments.
- Developed a cross-tutor collaboration system that enables seamless knowledge transfer via shared sessions notes, improving instructional continuity for students.

EcoPulse: Home Energy Dashboard (Back-end)

Tech Stacks: Java Spring Boot, Hibernate, Postman, PostgreSQL

Dec 2025 – Feb 2026

- Engineered a high-performance RESTful API using Spring Boot and Hibernate, providing a centralized back-end for real-time energy monitoring and environmental data.
- Implemented a secure authentication layer using Spring Security and JWT, utilizing custom request filters to manage tokens and differentiate between public and protected endpoints.
- Developed a sophisticated caching mechanism for the OpenWeatherMap API, persisting responses in PostgreSQL to minimize redundant network overhead and mitigate third-party rate-limiting risks.
- Built and tested API endpoints using Postman, ensuring consistent request/response handling and error management.
- Configured CI/CD pipelines using GitHub and Render, managing environment variables and deployment workflows across development and production environments.
- Developed unit and integration tests using JUnit and Mockito to validate service and controller layers.
